MDM
Case study: Western Regional Security

KEY RESULTS

- Reduction of data cost due to access to work-related apps only
- Enabled employees to leverage business apps and content in real-time with Application Management
- Monitored the device health and battery through the centralized dashboard of Scalefusion

TESTIMONY

"Scalefusion was a perfect solution that helped us curb the hefty data cost. Its diverse features ultimately took care of all our problems related to unchecked data, security and device usage."

ABOUT THE CLIENT

Providing the highest level of security services, Western Regional Security offers vehicle and standing guard patrol services on top of closed circuit and remote monitored video surveillance services.

CHALLENGES

The organization realized that they were unable to monitor and keep track of the activities of their employee's Android mobile devices. Lack of remote access led to unchecked usage of internet data by the employees which drove the overhead data cost due to misuse for personal activities. This incident apparently reflected the lack of employees' productivity and the organization needed a solution to reverse the impact.

SOLUTION

Western Regional Security deployed Scalefusion as their Kiosk lockdown solution on all the organization-owned Android mobile phones deployed to the employees. This solution reflected a positive change in the internet data cost and in the prevention of misuse of devices during work time. It also allowed IT Admins. to gain access to all devices remotely, set restrictions on data usage, eliminate threats to data security, and access the device health monitoring.
